

Group project

This is to be completed in Python. You are given a dataset that contains the geo-codes for where customers shop and where customers live. You need to create (as best as you can) an interactive map that accomplishes the following: when a user clicks a shop, the customers who shop there are highlighted, lines are drawn from all the customers to that shop, or some such visual that helps the user to visualize where a store's customers come from (see below):

Please feel free to use any tool that is available. You can turn in a notebook or a python file.
